Lecture 9 Randomly Built Binary Search Trees.

Song Jiang, Ph.D.

Department of Computer Science and Engineering

Binary-search-tree sort

$$T \leftarrow \emptyset$$
 > Create an empty BST

for
$$i = 1$$
 to n

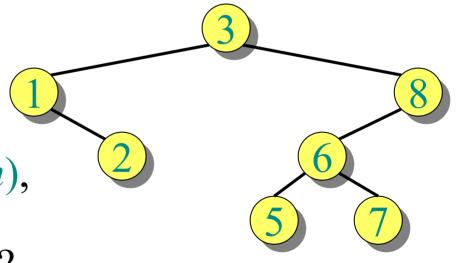

do Tree-Insert(T, A[i])

Perform an inorder tree walk of *T*.

Example:

$$A = [3 \ 1 \ 8 \ 2 \ 6 \ 7 \ 5]$$

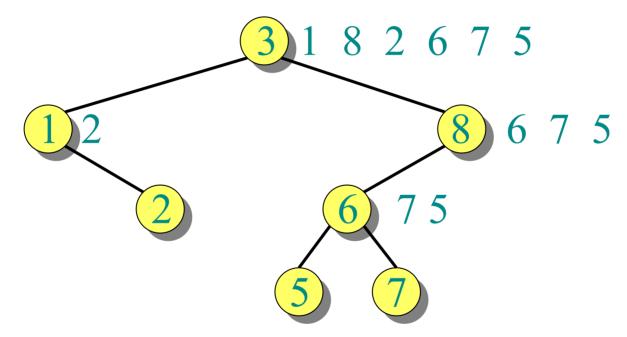

Tree-walk time = O(n), but how long does it take to build the BST?

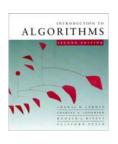

Analysis of BST sort

BST sort performs the same comparisons as quicksort, but in a different order!

The expected time to build the tree is asymptotically the same as the running time of quicksort.

Node depth

The depth of a node = the number of comparisons made during TREE-INSERT. Assuming all input permutations are equally likely, we have

Average node depth

$$= \frac{1}{n} E \left[\sum_{i=1}^{n} (\# \text{comparisons to insert node } i) \right]$$

$$= \frac{1}{n}O(n \lg n) \qquad \text{(quicksort analysis)}$$

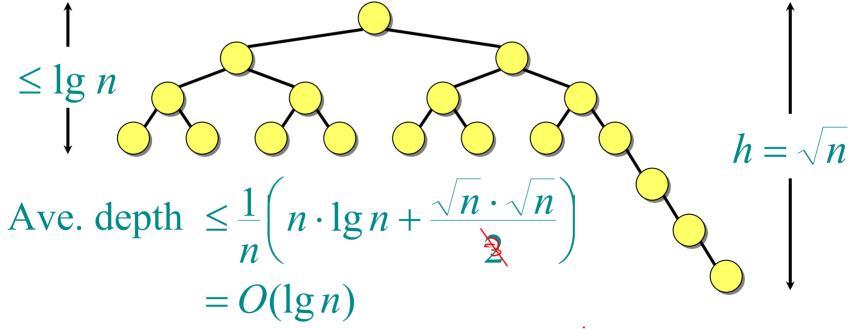

$$= O(\lg n)$$

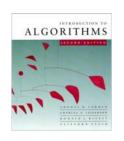

Expected tree height

But, average node depth of a randomly built $BST = O(\lg n)$ does not necessarily mean that its expected height is also $O(\lg n)$ (although it is).

Example.

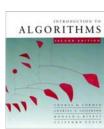

Height of a randomly built binary search tree

Outline of the analysis:

- Prove *Jensen's inequality*, which says that $f(E[X]) \le E[f(X)]$ for any convex function f and random variable X.
- Analyze the *exponential height* of a randomly built BST on n nodes, which is the random variable $Y_n = 2^{X_n}$, where X_n is the random variable denoting the height of the BST.
- Prove that $2^{E[X_n]} \le E[2^{X_n}] = E[Y_n] = O(n^3)$, and hence that $E[X_n] = O(\lg n)$.

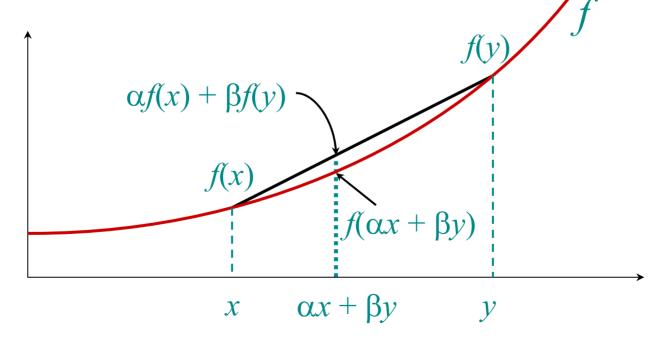

Convex functions

A function $f: \mathbb{R} \to \mathbb{R}$ is *convex* if for all $\alpha, \beta \ge 0$ such that $\alpha + \beta = 1$, we have

$$f(\alpha x + \beta y) \le \alpha f(x) + \beta f(y)$$

for all $x,y \in \mathbb{R}$.

Convexity lemma

Lemma. Let $f: \mathbb{R} \to \mathbb{R}$ be a convex function, and let $\alpha_1, \alpha_2, ..., \alpha_n$ be nonnegative real numbers such that $\sum_k \alpha_k = 1$. Then, for any real numbers $x_1, x_2, ..., x_n$, we have

$$f\left(\sum_{k=1}^{n}\alpha_k x_k\right) \leq \sum_{k=1}^{n}\alpha_k f(x_k).$$

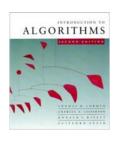

Proof. By induction on n. For n = 1, we have $\alpha_1 = 1$, and hence $f(\alpha_1 x_1) \le \alpha_1 f(x_1)$ trivially.

Inductive step:

$$f\left(\sum_{k=1}^{n} \alpha_k x_k\right) = f\left(\alpha_n x_n + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

Algebra.

Inductive step:

$$f\left(\sum_{k=1}^{n} \alpha_k x_k\right) = f\left(\alpha_n x_n + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

$$\leq \alpha_n f(x_n) + (1 - \alpha_n) f\left(\sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

Convexity.

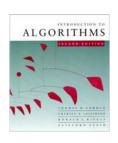

Inductive step:

$$f\left(\sum_{k=1}^{n} \alpha_k x_k\right) = f\left(\alpha_n x_n + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

$$\leq \alpha_n f(x_n) + (1 - \alpha_n) f\left(\sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

$$\leq \alpha_n f(x_n) + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} f(x_k)$$

Induction.

Inductive step:

$$f\left(\sum_{k=1}^{n} \alpha_k x_k\right) = f\left(\alpha_n x_n + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

$$\leq \alpha_n f(x_n) + (1 - \alpha_n) f\left(\sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} x_k\right)$$

$$\leq \alpha_n f(x_n) + (1 - \alpha_n) \sum_{k=1}^{n-1} \frac{\alpha_k}{1 - \alpha_n} f(x_k)$$

$$= \sum_{k=1}^{n} \alpha_k f(x_k). \quad \square \quad \text{Algebra.}$$

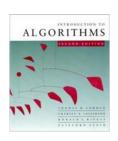

Convexity lemma: infinite case

Lemma. Let $f: \mathbb{R} \to \mathbb{R}$ be a convex function, and let $\alpha_1, \alpha_2, \ldots$, be nonnegative real numbers such that $\sum_k \alpha_k = 1$. Then, for any real numbers x_1, x_2, \ldots , we have

$$f\left(\sum_{k=1}^{\infty}\alpha_k x_k\right) \leq \sum_{k=1}^{\infty}\alpha_k f(x_k),$$

assuming that these summations exist.

Convexity lemma: infinite case

Proof. By the convexity lemma, for any $n \ge 1$,

$$f\left(\sum_{k=1}^{n} \frac{\alpha_k}{\sum_{i=1}^{n} \alpha_i} x_k\right) \leq \sum_{k=1}^{n} \frac{\alpha_k}{\sum_{i=1}^{n} \alpha_i} f(x_k).$$

Convexity lemma: infinite case

Proof. By the convexity lemma, for any $n \ge 1$,

$$f\left(\sum_{k=1}^{n} \frac{\alpha_k}{\sum_{i=1}^{n} \alpha_i} x_k\right) \leq \sum_{k=1}^{n} \frac{\alpha_k}{\sum_{i=1}^{n} \alpha_i} f(x_k).$$

Taking the limit of both sides (and because the inequality is not strict):

$$\lim_{n \to \infty} f\left(\frac{1}{\sum_{i=1}^{n} \alpha_{i}} \sum_{k=1}^{n} \alpha_{k} x_{k}\right) \leq \lim_{n \to \infty} \frac{1}{\sum_{i=1}^{n} \alpha_{i}} \sum_{k=1}^{n} \alpha_{k} f(x_{k})$$

$$\to 1 \to \sum_{k=1}^{\infty} \alpha_{k} x_{k}$$

$$\to 1 \to \sum_{k=1}^{\infty} \alpha_{k} f(x_{k})$$

Jensen's inequality

Lemma. Let f be a convex function, and let X be a random variable. Then, $f(E[X]) \le E[f(X)]$.

Proof.

$$f(E[X]) = f\left(\sum_{k=-\infty}^{\infty} k \cdot \Pr\{X = k\}\right)$$

Definition of expectation.

Jensen's inequality

Lemma. Let f be a convex function, and let X be a random variable. Then, $f(E[X]) \le E[f(X)]$.

Proof.

$$f(E[X]) = f\left(\sum_{k=-\infty}^{\infty} k \cdot \Pr\{X = k\}\right)$$

$$\leq \sum_{k=-\infty}^{\infty} f(k) \cdot \Pr\{X = k\}$$

Convexity lemma (infinite case).

Jensen's inequality

Lemma. Let f be a convex function, and let X be a random variable. Then, $f(E[X]) \le E[f(X)]$.

Proof.

$$f(E[X]) = f\left(\sum_{k=-\infty}^{\infty} k \cdot \Pr\{X = k\}\right)$$

$$\leq \sum_{k=-\infty}^{\infty} f(k) \cdot \Pr\{X = k\}$$

$$=E[f(X)].$$

Tricky step, but true—think about it.

Analysis of BST height

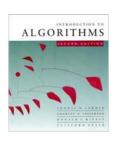

Let X_n be the random variable denoting the height of a randomly built binary search tree on n nodes, and let $Y_n = 2^{X_n}$ be its exponential height.

If the root of the tree has rank k, then

$$X_n = 1 + \max\{X_{k-1}, X_{n-k}\},$$

since each of the left and right subtrees of the root are randomly built. Hence, we have

$$Y_n = 2 \cdot \max\{Y_{k-1}, Y_{n-k}\}$$
.

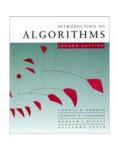

Analysis (continued)

Define the indicator random variable Z_{nk} as

$$Z_{nk} = \begin{cases} 1 & \text{if the root has rank } k, \\ 0 & \text{otherwise.} \end{cases}$$

Thus,
$$\Pr\{Z_{nk} = 1\} = E[Z_{nk}] = 1/n$$
, and

$$Y_n = \sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\}).$$

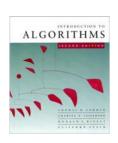

$$E[Y_n] = E\left[\sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})\right]$$

Take expectation of both sides.

$$E[Y_n] = E\left[\sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})\right]$$
$$= \sum_{k=1}^n E[Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})]$$

Linearity of expectation.

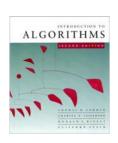

$$E[Y_n] = E\left[\sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})\right]$$

$$= \sum_{k=1}^n E[Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})]$$

$$= 2\sum_{k=1}^n E[Z_{nk}] \cdot E[\max\{Y_{k-1}, Y_{n-k}\}]$$

Independence of the rank of the root from the ranks of subtree roots.

$$E[Y_n] = E\left[\sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})\right]$$

$$= \sum_{k=1}^n E[Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})]$$

$$= 2\sum_{k=1}^n E[Z_{nk}] \cdot E[\max\{Y_{k-1}, Y_{n-k}\}]$$

$$\leq 2\sum_{k=1}^n E[Y_{k-1} + Y_{n-k}]$$

The max of two nonnegative numbers is at most their sum, and $E[Z_{nk}] = 1/n$.

$$E[Y_n] = E\left[\sum_{k=1}^n Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})\right]$$

$$= \sum_{k=1}^n E[Z_{nk} (2 \cdot \max\{Y_{k-1}, Y_{n-k}\})]$$

$$= 2\sum_{k=1}^n E[Z_{nk}] \cdot E[\max\{Y_{k-1}, Y_{n-k}\}]$$

$$\leq \frac{2}{n}\sum_{k=1}^n E[Y_{k-1} + Y_{n-k}]$$

$$= \frac{4}{n}\sum_{k=0}^{n-1} E[Y_k]$$
Each term appears twice, and reindex.

Use substitution to show that $E[Y_n] \le cn^3$ for some positive constant c, which we can pick sufficiently large to handle the initial conditions.

$$E[Y_n] = \frac{4}{n} \sum_{k=0}^{n-1} E[Y_k]$$

Use substitution to show that $E[Y_n] \le cn^3$ for some positive constant c, which we can pick sufficiently large to handle the initial conditions.

$$E[Y_n] = \frac{4}{n} \sum_{k=0}^{n-1} E[Y_k]$$

$$\leq \frac{4}{n} \sum_{k=0}^{n-1} ck^3$$

Substitution.

Use substitution to show that $E[Y_n] \le cn^3$ for some positive constant c, which we can pick sufficiently large to handle the initial conditions.

$$E[Y_n] = \frac{4}{n} \sum_{k=0}^{n-1} E[Y_k]$$

$$\leq \frac{4}{n} \sum_{k=0}^{n-1} ck^3$$

$$\leq \frac{4c}{n} \int_0^n x^3 dx$$

Integral method.

Use substitution to show that $E[Y_n] \le cn^3$ for some positive constant c, which we can pick sufficiently large to handle the initial conditions.

$$E[Y_n] = \frac{4}{n} \sum_{k=0}^{n-1} E[Y_k]$$

$$\leq \frac{4}{n} \sum_{k=0}^{n-1} ck^3$$

$$\leq \frac{4c}{n} \int_0^n x^3 dx$$

$$= \frac{4c}{n} \left(\frac{n^4}{4}\right)$$

Solve the integral.

Use substitution to show that $E[Y_n] \le cn^3$ for some positive constant c, which we can pick sufficiently large to handle the initial conditions.

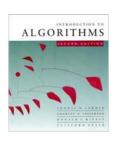

$$E[Y_n] = \frac{4}{n} \sum_{k=0}^{n-1} E[Y_k]$$

$$\leq \frac{4}{n} \sum_{k=0}^{n-1} ck^3$$

$$\leq \frac{4c}{n} \int_0^n x^3 dx$$

$$= \frac{4c}{n} \left(\frac{n^4}{4}\right)$$

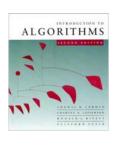

$$= cn^3. \text{ Algebra.}$$

Putting it all together, we have

$$2^{E[X_n]} \leq E[2^{X_n}]$$

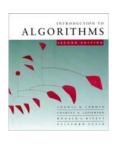

Jensen's inequality, since $f(x) = 2^x$ is convex.

Putting it all together, we have

$$2^{E[X_n]} \le E[2^{X_n}]$$
$$= E[Y_n]$$

Definition.

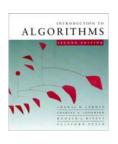

Putting it all together, we have

$$2^{E[X_n]} \le E[2^{X_n}]$$

$$= E[Y_n]$$

$$\le cn^3.$$

What we just showed.

Putting it all together, we have

$$2^{E[X_n]} \le E[2^{X_n}]$$

$$= E[Y_n]$$

$$\le cn^3.$$

Taking the lg of both sides yields

$$E[X_n] \le 3 \lg n + O(1).$$
